Assignment 3

1. Mergesort

Do even-odd megesort. Implement method(s) to sort inputs values should be sorted such that it separates even and odd values.

Example input:

	2	5	1	8	9	12	17	4
Output:								
	2	4	8	12	1	5	9	17

2. Quicksort

Sort an array of lowercase characters using Quicksort. The selection of the pivot element involves computing the decimal representation in the ASCII table for each character in the array, summing these representations, dividing the sum by the number of elements in the array (rounding down to the nearest integer if there are decimal points), and then performing a modulo operation with the number of elements. The remainder obtained from this operation is utilized as the index for the pivot element in the sorting process.

Example, using above table:

 $\{f,m,n,t,r,k,q,w\}$ - 8

102 + 109 + 110 + 116 + 114 + 107 + 113 + 119 = 890/8 = 111.25, floor(111.25) = 111%8 = 7. Pick index 7 as a pivot('w').

Use another array characters for you assignment.
